Question 1: Meaningful Distinct Segments

Intel's survey collected responses from 1,000 university alumni, rating seven smartwatch attributes on a 1–7 Likert scale: Constant Communication, Timely Information, Task Management, Device Sturdiness, Wellness, Athletic features, and Style, they capture the costumer’s needs or the so called ‘total configuration’for a smartwatch, rather than descriptive demographics which are reserved for the post-hoc profiling but not for the base of the segmentation (Haley, 1968). To determine how many distinct customer groups exist within this sample, a multi-method clustering approach was applied, with the choice of k validated across several independent methods.

1. *Data Preparation*

All seven segmentation variables were measured on the same 1–7 Likert scale but were nonetheless standardized before clustering. Since clustering algorithms operate on distance, any variable with a wider response spread would carry disproportionate weight in the calculation. Standardization ensures that each attribute contributes equally to the formation of clusters.

2. *Elbow Plot*

There is no fixed rule for choosing the number of clusters since too few may hide meaningful differences, while too many might create artificial and unrealistic groups. In order to ensure a robust solution, three methods were compared. Firstly, a Within-Sum-of-Squares (WSS) elbow plot on the standardized data was carried out. The curve bends clearly at k = 4, after which the drop in WSS becomes marginal.

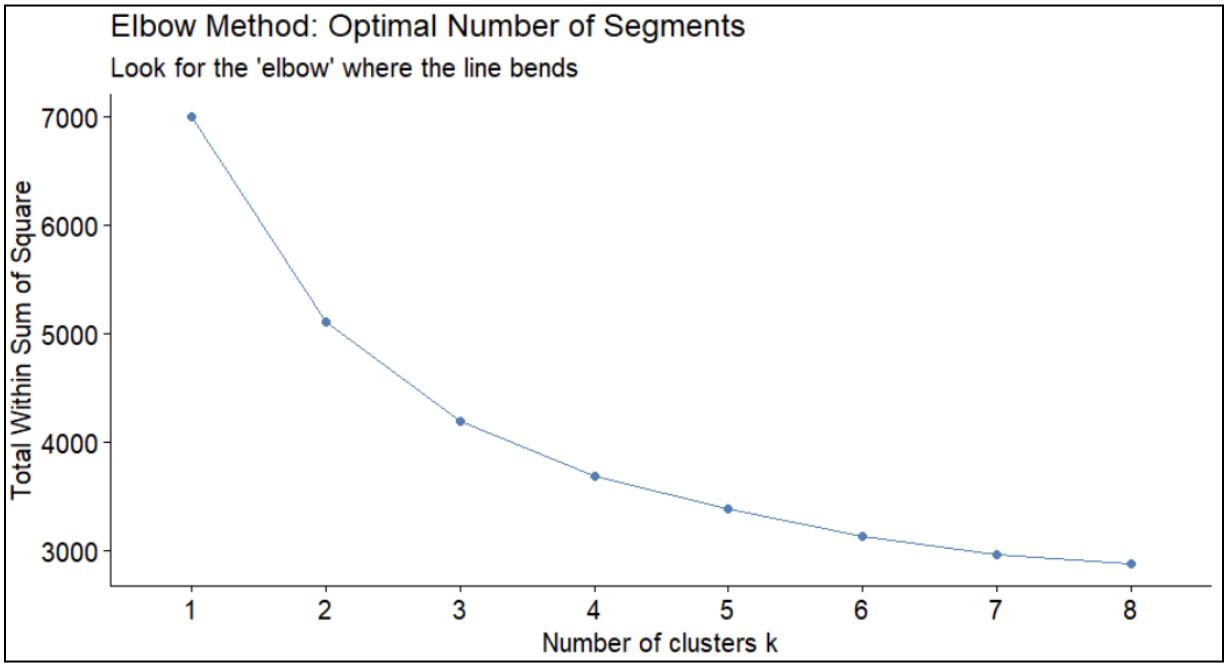

Figure 1: DETERMINING OPTIMAL NUMBER OF SEGMENTS (ELBOW METHOD)

Secondly, a hierarchical clustering using Ward's D2 diagnosis was applied as an independent methodological check. Unlike k-means, it builds clusters bottom-up by merging the most similar respondents step by step. In addition, the dendrogram shows four cleanly separated branches, and the supporting merge-height plot also points to k = 4.

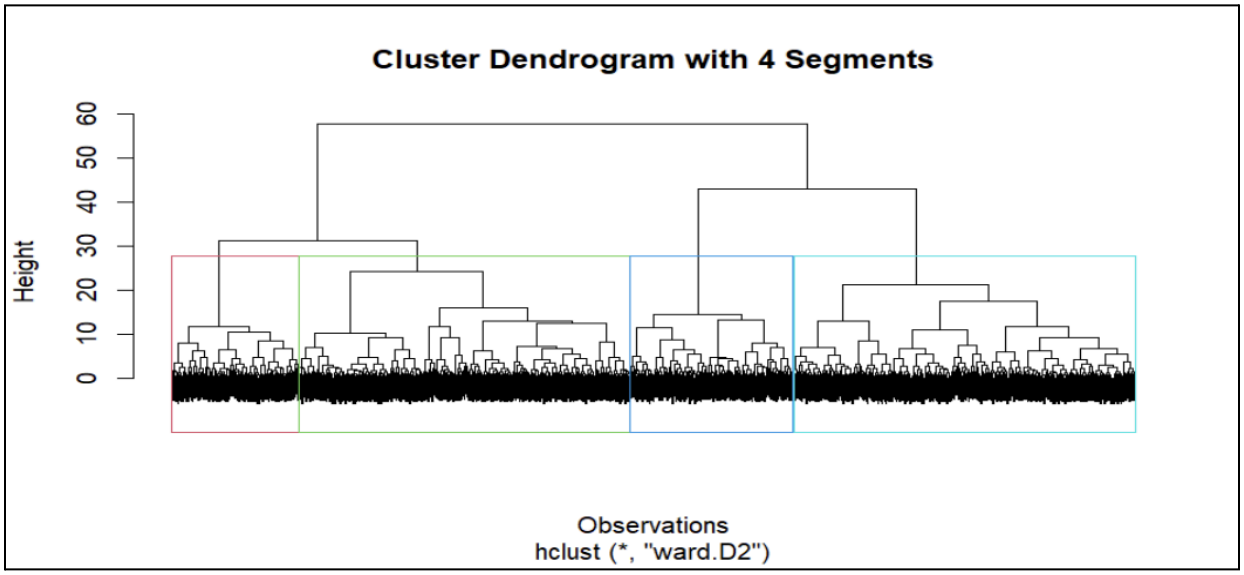

Figure 2: Dendrogram with 4 highlighted clusters

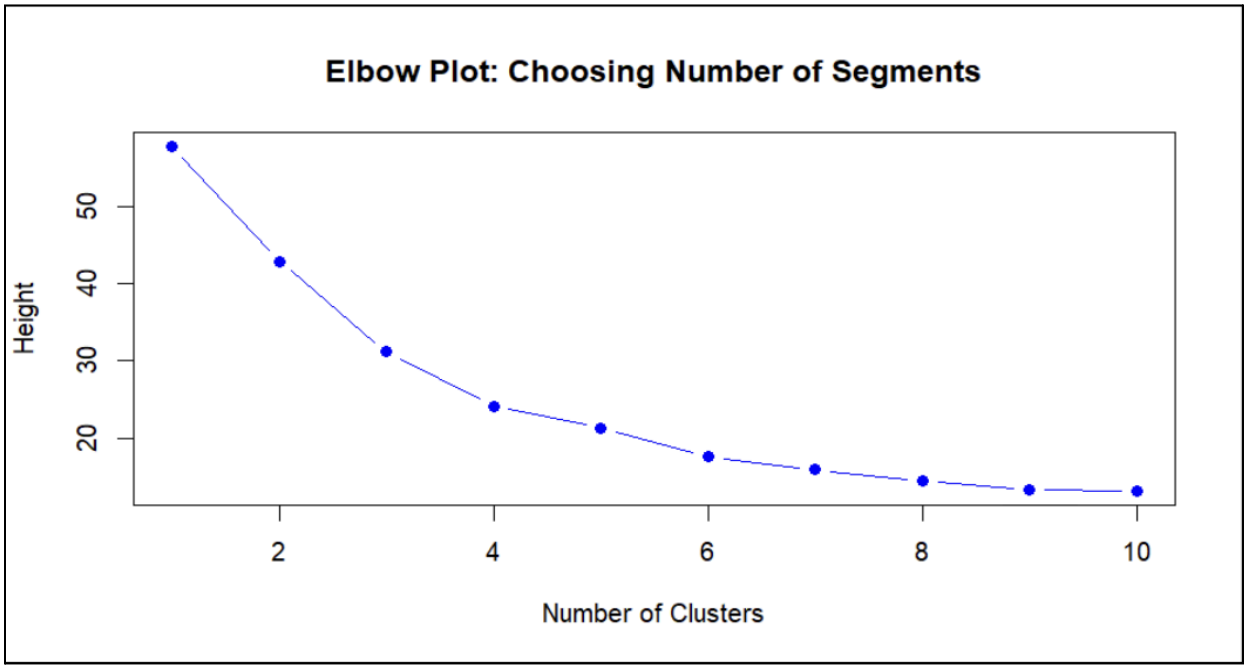

Figure 3: Elbow plot using merge heights

Thirdly, a WSS elbow on PCA-reduced data diagnosis was carried out. Likert-scale survey data often have correlated variables; for instance, respondents who value Wellness highly also tend to value Athletic features highly. The stated overlap might make the cluster boundaries less clear when k-means is run on the raw variables. The solution lies in PCA, which reorganizes the data along new axes that are uncorrelated, thereby removing the overlap. The elbow was then re-run on the first two of these new axes (the principal components), and the bend at k = 4 came out sharper than on the raw data.

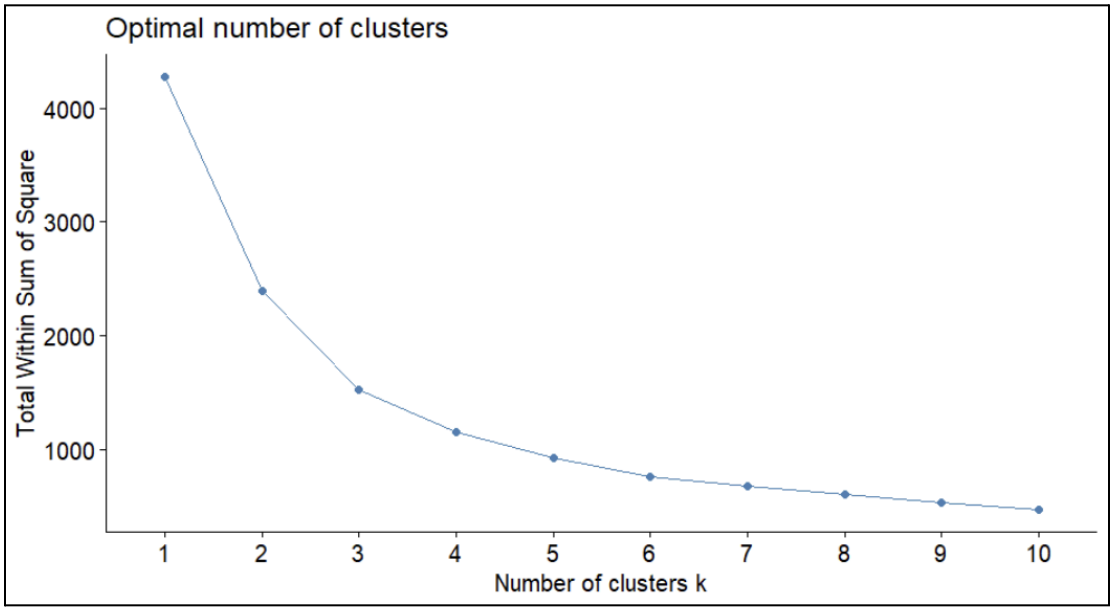

Figure 4: K-means on PCA-reduced data

3. Are the segments different at all?: One-way ANOVA

A clean elbow shows that the algorithm can split the data into four groups, but to prove to be significantly different, requires testing. A one-way ANOVA was conducted on each of the seven segmentation variables to test whether cluster means differ. With n = 1,000, sample size alone makes almost any difference statistically significant, so eta-squared (η2) was used as a

more informative measure of how much of the variation in each attribute is explained by cluster membership.

Variable	F_value	p_value	eta_squared	Effect_size	Levene_p	Levene_warn	p_bonferroni	Sig_after_bonf
Wellness	592.8	5.493E-221	0.641	Large	1.033E-17	Unequal var - use Welch	4.944E-220	***
Style	482.76	1.321E-193	0.593	Large	0.001317	Unequal var - use Welch	1.189E-192	***

Figure 5: ANOVA Testing Table

Every single attribute shows a large effect ($\eta 2 \geq 0.14$ by Cohen's convention), and Wellness alone has $\eta 2 = 0.641$, meaning the four-cluster solution explains 64% of all variation in how respondents prioritize well-being features. Furthermore, running seven separate tests at once raises the risk that something will look significant purely by chance. To guard against that, the Bonferroni correction was applied, adjusting each p-value upward to keep the overall false-positive rate at 5% across the family of tests. Every variable still resulted in $p < 0.001$ after correction (the Sig_after_bonf), confirming the results were not due to noise.

4. Were the standard assumptions met?: Levene's test and Welch ANOVA

Variable	F_value	p_value	eta_squared	Effect_size	Levene_p	Levene_warn	p_bonferroni	Sig_after_bonf
Wellness	592.8	5.493E-221	0.641	Large	1.033E-17	Unequal var -	4.944E-220	***
Style	482.76	1.321E-193	0.593	Large	0.001317	Unequal var -	1.189E-192	***
Athlete	422.48	5.421E-177	0.56	Large	1.832E-11	Unequal var -	4.879E-176	***
TaskMgm	212.74	1.266E-106	0.391	Large	2.425E-32	Unequal var -	1.139E-105	***
Age	210.95	6.531E-106	0.389	Large	7.492E-22	Unequal var -	5.878E-105	***

ConstCom	150.4	2.18E-80	0.312	Large	0.0002187	Unequal var -	1.962E-79	***
Income	52.32	2.106E-31	0.136	Medium	1.018E-07	Unequal var -	1.895E-30	***

Figure 6: Levene's test and Welch ANOVA

Standard ANOVA assumes the four clusters have roughly equal variances around their means. The assumption was tested with Levene's test, which flagged unequal variances for every variable, unsurprising given that clusters with low mean scores naturally have less spread to work with than mid-scale clusters. To verify, each test was re-run as Welch's ANOVA, which does not require equal variances. The F-statistics resulted in higher values under Welch (ex. Wellness rose from F = 592.80 to 657.45), ensuring that differences between segments are real regardless of which test is applied.

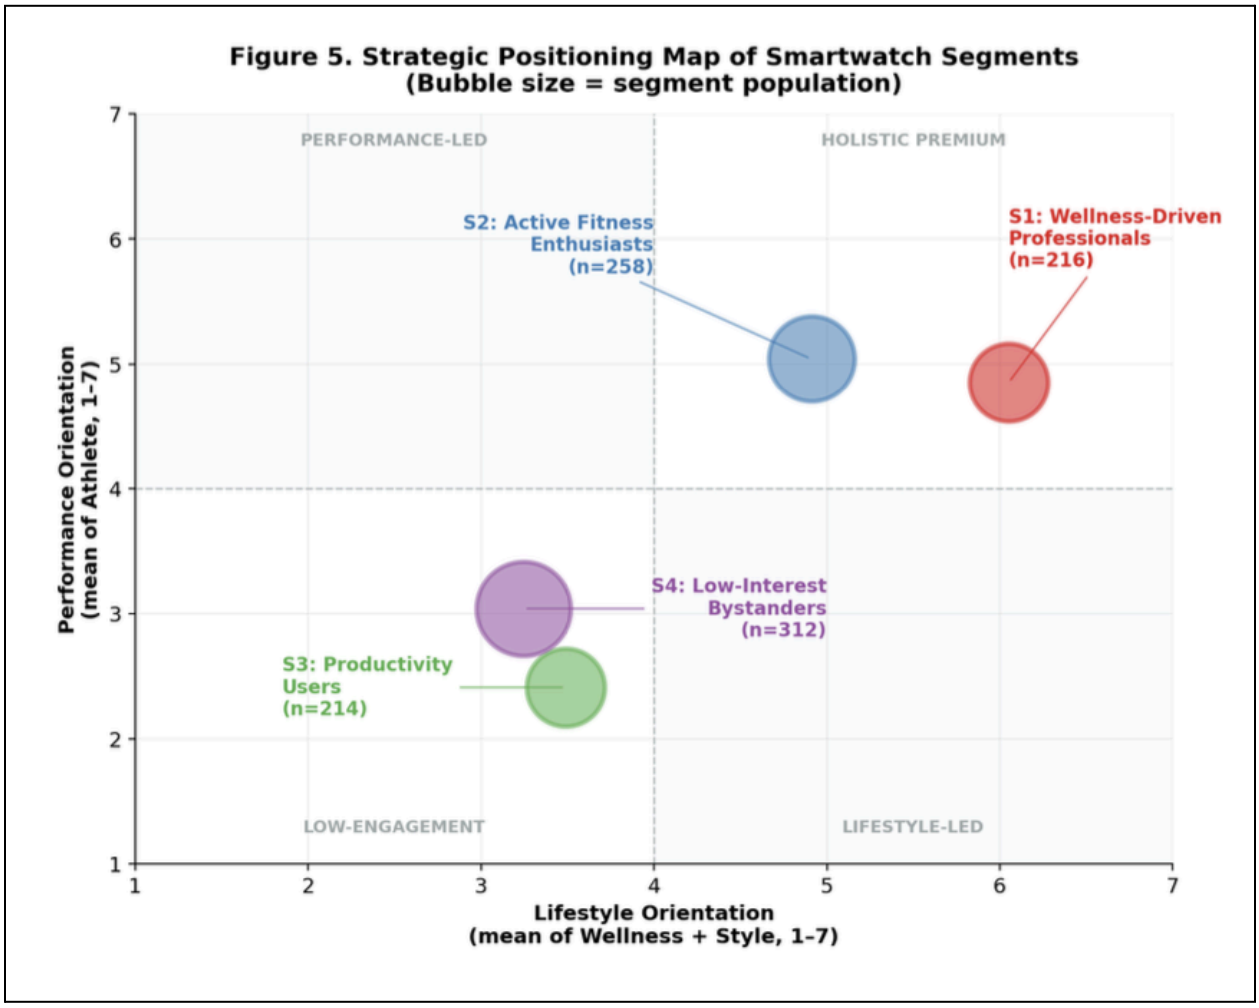

6. Which segments differ from which? — Tukey HSD

ANOVA solely identifies that at least one pair of the clusters is significant; however, it does not specify which pairs. Tukey's Honest Significant Difference test does pairwise comparisons across every combination of clusters and shows where the real gaps lie. The results illustrated a clean separation on almost every variable, but the few non-significant pairs also proved to be useful — Athletic scores are statistically tied between Segments 1 and 2, confirming both are fitness-engaged but for different reasons, while Style is equally low in Segments 3 and 4.

Table 1: Mean Score of Attributes

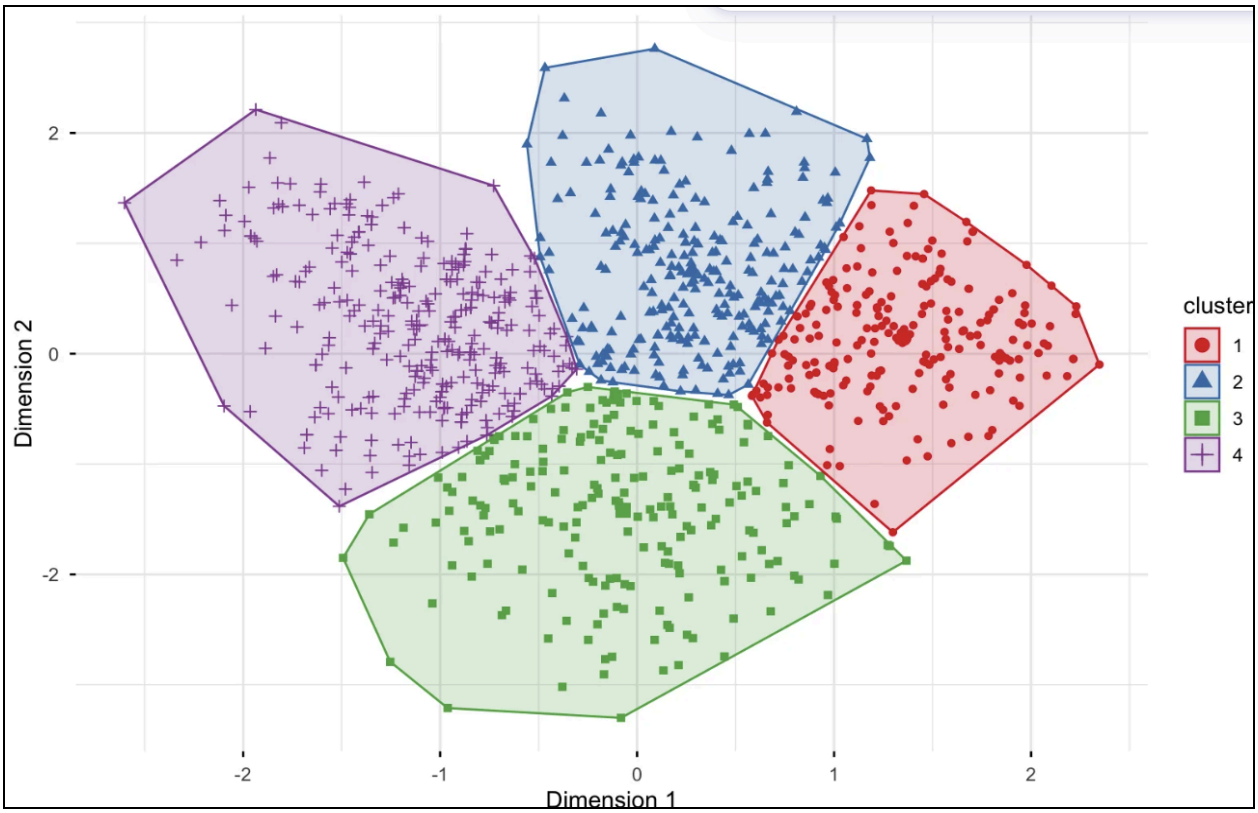

Figure 8: Cluster Analysis

1. Segment 1: Healthy Professionals (21.6%)

The current segment is, in the majority, composed of women working in office jobs. They are 31.6 years old on average, and 69% are female. They sit in the highest income bracket of the sample (3.77), and 61% hold a postgraduate degree, with 78% holding an Amazon Prime account. They score high on Wellness (6.22), Style (5.88), and Task Management (5.54). As a result, assistance for staying healthy, managing the day-to-day basis and staying sophisticated is required. Wellness is the priority and sets them apart from every other segment, and due to their high income bracket, they are supposed to be in a strong position to afford a smartwatch that meets their needs.

2. **Segment 2: Fitness Enthusiasts (25.8%)**

Fitness defines the current group. Whereas Athlete (5.04) is their highest score, and it is supported by strong Wellness (5.23), their interest drops in other features. They are 31.7 years old on average, 59% female, and sit in the middle-income bracket (3.29). 23% hold a postgraduate degree. They want their watch to track and improve their athletic performance. Style and communication features are a "nice to have" for them rather than a deciding factor when buying the product, because their main concern lies in the fitness and wellness area. Even though their incomes are lower than those of Segment 1, they are still reachable. If a brand were to prove that their watch genuinely improves their training, deductively thinking, it could be said that the segment would consider spending on it as performance is a priority.

3. **Segment 3: Busy Professionals (21.4%)**

The current segment is defined by an information and communication-first orientation. It can be seen that Timely Information (5.73) scores high as well as Constant Communication (5.56), while Wellness (3.49), Athlete (2.41), and Style (3.49) remain considerably lower. They are on average 39 years old, mid-to-high income bracket (3.63), and are evenly split by gender (51% female). Their priorities line up closely with features that come built into most smartphones, which suggests that competitors like the Apple Watch and Samsung Galaxy Watch are likely to have launched a product that already meets their needs. For Intel, this would be a challenging segment to win over.

4. **Segment 4: Disengaged Users (31.2%)**

The largest but least engaged segment in the category. They score lowest on every attribute, with all means below 3.7. They are 39 years old on average, sit in the lowest income bracket (2.73), and are evenly split by gender. 19% hold a postgraduate qualification, and Amazon Prime adoption is the lowest at 42%. Their low scores across every attribute suggest the smartwatch category does not really appeal to them as it is. For Intel, this segment would not make a sensible target given how little engagement they show with the features in the survey.

Market Contextualization and Business Landscape

The business landscape has significantly changed since the current case study was originally framed.

Aetna was structurally integrated into the CVS Health Group. Therefore, the recommended partnership does not rely on an isolated agreement with Aetna, but a corporate ecosystem alliance with CVS Health. Moreover, in April 2026, CVS Health launched Health 100, a specialized corporate tech subsidiary designed to provide digital healthcare infrastructure and data-driven wellness ecosystems. Furthermore, a recent press release from CVS Health Group states that: “the future integration of biometric wearable technology can enable a proactive, data-driven support system that helps consumers manage their health in real-time…” (CVS Health, 2026) which is a direct corporate invitation for a partner like Intel to step in.

Google is fundamentally not a viable partner but a direct competitor instead due to their commercial presence with the Pixel watch, “Fitbit” and the "Fitbit band”. Furthermore, whereas the majority of the sample has an active Amazon Prime account, Amazon is highly unlikely to

show strategic interest in this specific venture due to having abandoned the wearable field after the discontinuation of the Halo Division (Reuters, 2023).

Recently, Intel has pioneered in AI automated disease detection, secure multi-party federated learning for hospital systems, and edge-computing biomedical analytics. While these advancements have heavily targeted clinical and hospital infrastructure, they provide the exact microprocessing credibility, clinical-grade precision, and software validation architecture needed to deploy a high-performance consumer health wearable.

Strategic Alliances & Value Proposition

It is strongly advisable for Intel to partner with CVS Health Group, which, by extension, establishes an alliance with Aetna and Health 100.

Resource Allocation per Partner:

- **Intel:** Delivers an advanced technological development in hardware and health detection advancements, and an unparalleled brand equity of engineering trust (Benson, 2026).
- **Aetna:** Provides the strength of a top-tier health insurance infrastructure with deep institutional access through active corporate wellness frameworks, preventive health insurance plan incentives and direct employer-sponsored benefits. Consequently, a highly established B2B customer network is provided, allowing the device to be co-financed or subsidized as a corporate wellness asset (Heartford, 2026).

- **CVS Health Group:** Supplies immediate retail dominance with over 9,000 physical retail pharmacies across the United States (Japsen, 2026), providing a trusted distribution network. CVS also brings robust e-commerce capabilities, fully established nationwide medical supply chains, and deeply embedded consumer loyalty programs like “ExtraCare” (Ashcroft, 2024).
- **Health 100:** Contributes a medical AI software engine, predictive analytics, and agile software development teams.

A Handled Threat

Task Management activities are essential for the targeted segments and since none of the companies involved in the product development can fulfill this need by themselves, the proposed line of action is to hire Microsoft as a supplier, since there is no lack of hardware conflict of interest after the Microsoft Band's total shutdown years ago (Weinberg, 2019). Furthermore, this alliance applies indirect yet precise competitive pressure on Google by countering its Android/Workspace ecosystem with an elite Intel/Microsoft alternative.

Question 3:Targeting & Positioning

Evaluation Framework

To target the most viable segment, the four customer segments created were evaluated using the GE framework. The segment attractiveness was assessed across five criteria: income level, feature engagement, segment size, leverage of Aetna's corporate wellness channels, and growth potential in the wellness market. In terms of Intel's competitive strength, it was evaluated across four dimensions: sensor technology, partner ecosystem advantage, competitive landscape, and market gap fulfillment.

Segment Framework:

Segment 1: Healthy Professionals (21.6%)

Healthy Professionals presents the most commercially viable segment for Intel; they illustrate the willingness and ability to invest in a premium smartwatch based on their ratings, with the highest income (3.77), strongest feature engagement on wellness (6.22), and task management (5.54). Leveraging Aetna's corporate wellness programs brings high reachability in targeting through employer-sponsored benefits. In terms of competitive strength, there is no existing company combining insurance-backed wellness with productivity, making this rated high for Intel. As a result, this suggests that a strategic partnership with Aetna addresses the unmet needs and is uniquely positioned.

Segment 2: Fitness Enthusiasts (25.8%)

Fitness Enthusiasts represent a secondary consideration target segment for Intel. Defined by fitness (5.04) and wellness (5.23) attributes, despite its lower income (3.29), it is still reachable. Defined by fitness, leveraging Aetna's programs for reachability is limited, as the segment is driven by athletic performance rather than employer wellness programs. The competitive strength of Intel will be rated as moderate because of the competitive barrier that already exists, and it is dominated by Garmin.

Segment 3: Busy Professional (21.4%)

Busy professionals were de-prioritized based on the analysis conducted. This segment scores low on attractiveness, as consumers are more connectivity-centric, based on the ratings: TimelyInf (5.73) and ConstCom (5.56). These attributes correspond to product offerings from Apple and Samsung that are embedded with smartphone integration. Intel's competitive strength is rated low due to the barrier to entry posed by Apple's dominance.

Segment 4: Disengaged Users (31.2%)

Disengaged users are the largest in number, bit is the least commercially attractive. Based on the analysis, the scores were below 3.7 across all attributes, with the lowest in income (2.73) out of the four segments. The competitive strength is rated relatively low, associated with risks and high conversion costs, because of consumer having no preferences on smartwatches and no unaddressed needs for Intel's partnership to address, making this segment unattractive.

GE Matrix

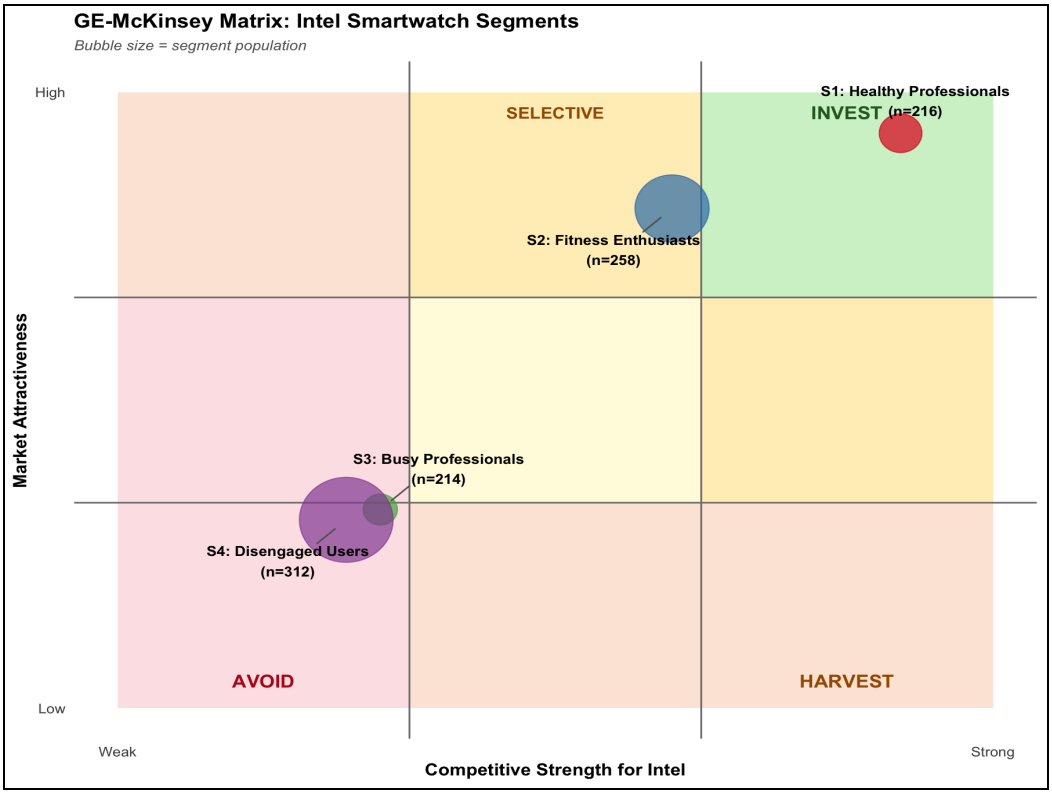

Figure 9: GE-Matrix

Based on Figure 9, Segment 1 is within the invest quadrant, indicating the high attractiveness induced by the high income ratings (3.77), alongside the highest engagement features for wellness (6.22) and task management (5.54), which are directly reachable via Aetna's corporate wellness programs. In addition, Intel's productivity integration and credibility in insurance-backed wellness determine its competitive strength as high, since no existing company offers this combination. Segment 2, positions within the selective quadrant, reflecting Intel's secondary opportunity, but is constrained by Garmin's dominance in this athletic field. The limitation of Aetna in reachability would be high despite the intriguing ratings in athlete (5.04) and wellness (5.23). In terms of segments 3 and 4, they fall in the avoid zones as the Busy Professionals segment is already well served by Apple and Samsung, and Disengaged Users illustrates no smartwatch engagement.

Perceptual Map: Competitive Positioning Analysis

To assess Intel's competitive position within the current smartwatch market, a perceptual map was constructed with a combination of judgment and secondary resources to reflect the current market (Kotler & Keller, 2016). The y-axis represents the wellness and fitness orientation, and the x-axis represents the task management and productivity orientation. The selection of the axis attributes was derived from the two primary dimensions determined in the PCA analysis. While Intel has not yet launched a product, its designated position is based on the target segment's feature priorities and the leveraging of the strategic partnership with Aetna. In addition, secondary resources were used to assist in the competitors' positionings based on smartwatch brand perception (Filip et al., 2024). Although the attributes conducted in Filip et al. (2024) were different, their attributes in the Emotional Appeal and Functional Practicality illustrated the most resemblance with wellness and productivity, providing a reliable baseline for the competitors' positions.

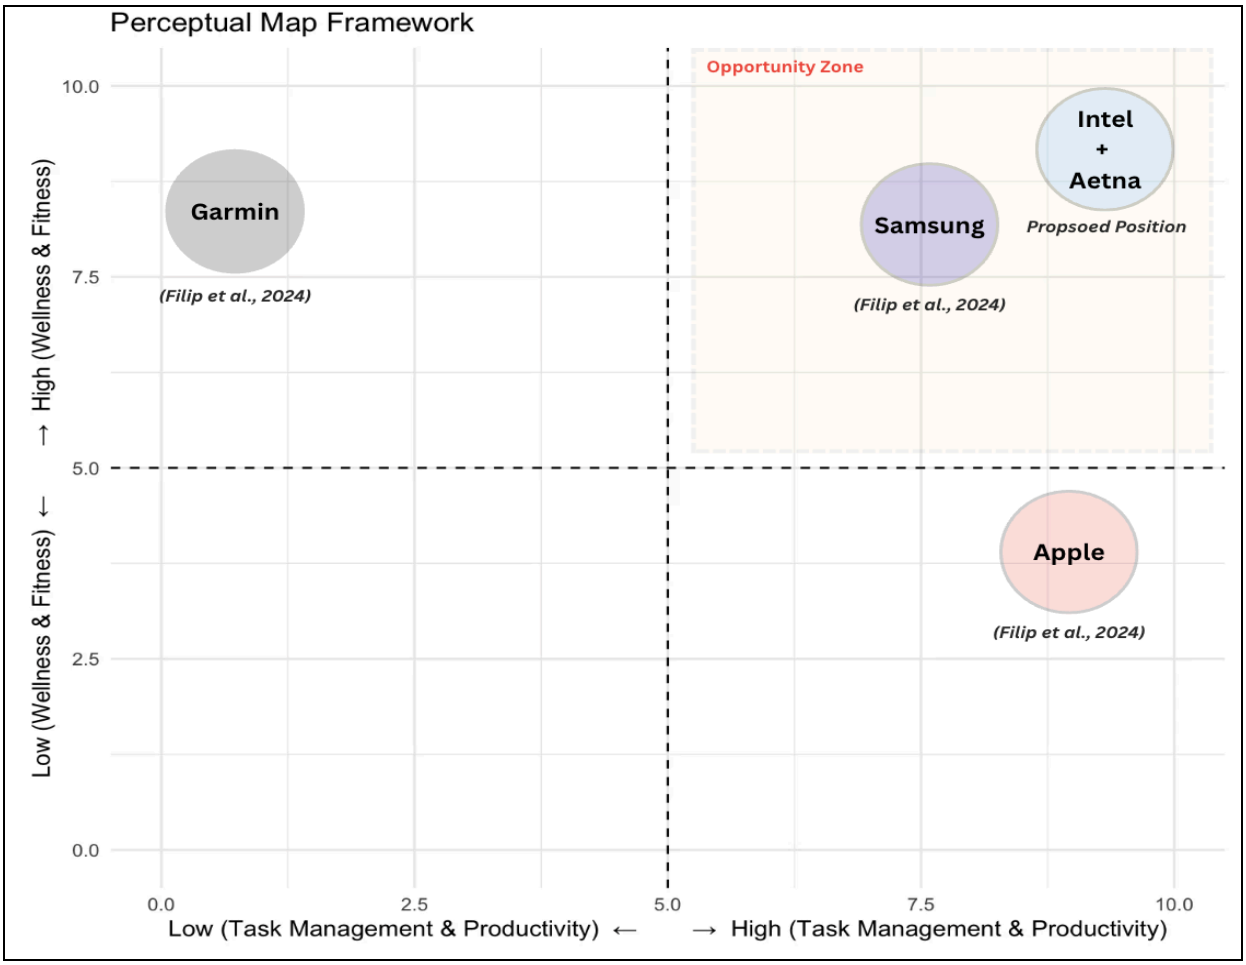

Figure 10: Perceptual Framework

As demonstrated in Figure 10, Apple's strong smartphone ecosystem and emotional appeal place it in high task management and productivity (Filip et al., 2024). Garmin is positioned in the left quadrant, since its product is more focused on fitness and wellness orientation, rather than task management or productivity (Filip et al., 2024). The closest competitor to Intel's strategic partnership would be Samsung, as it contributes to a balance of both dimensions, driven by its credentials in wellness through partnerships with health institutions, such as sleep apnea research (Samsung, 2026). The opportunity zone for Intel, as presented in the upper right quadrant, is the combination of advanced wellness monitoring and

strong task management integration. Intel's strategic partnership with Aetna is suitable and is uniquely positioned to occupy this space, supported by Aetna's insurance-backed corporate wellness distribution and Microsoft's 365 productivity integration, as well as Intel's and Health 100's advancements in health technology.

Intel's Partnership SWOT Analysis

STRENGTHS	WEAKNESSES	OPPORTUNITIES	THREATS
Edge AI and NPU (HIPAA-compliant health analytics)	Ineffective wearable branding and high requirement for marketing	Growing corporate wellness spending	Apple's leadership in the market among health-aware consumers
Healthcare partnership credibility with Aetna, 70+ programs, 9,000 CVS stores	Slow B2B sales cycles and reliance on Aetna	Leveraging Aetna's claims data for predictive wellness analytics	Risk associated with regulation compliance (HIPAA and data protection)
Significant R&D and marketing investment for continued competition	Late entry into the market compared to other companies	International expansion with other health insurance companies	Samsung Galaxy Watch's superior Android compatibility

Competitor SWOT Analysis

APPLE	GARMIN	SAMSUNG	INTEL+AETNA

S: Lock-in for ecosystems, brand loyalty, dominant retailers | W: Premium pricing strategy locks out price-sensitive professionals | O: Wellness enterprise development; health service monetization | T: Health information regulation; Intel-Aetna wellness strategy	S: GPS/fitness specialization | W: Perceived budget constraints; no insurer relationships O: Enterprise health programs; expansion of medical-grade wearables T: Competition from Intel+Aetna in health niche; Samsung health relationships	S: Android compatibility, mid-range | W: No insurer relationships; weak brand differentiators O: Relationships with health insurers; growth in developing nations T: Fragmented nature of Android platform; less credibility against Intel+Aetna	S: Healthcare credibility, business-to-business sales advantage, HIPAA compliance AI | W: Unknown wearables brand; long business-to-business sales cycle O: Underserved B2B health market; integration of healthcare data through Aetna T: Brand dominance of Apple products; Google/Fitbit health ecosystem

Go-to-Market Strategy

Step 1: The primary channel is B2B corporate wellness through Aetna (70+ existing corporate programs); Intel watches along with it as a part of a healthcare incentive program in the corporate benefit plan.

Step 2: The secondary channel is retail - CVS Health (9,000+ stores) to serve non-corporate users.

Step 3: Expansion phase - going full global.

In this regard, the success of the aforementioned strategy can be attributed to the reputation created by Aetna in insurance products. Another advantage of the B2B approach is that there would not be any competition with Apple at the luxury level of products.

Implementation Roadmap

Figure 11: Phased Market Entry

Comments on Subscription Model and Data Limitations

Even though the provided dataset suggests customers may favour subscriptions (78% of Healthy Professionals and 60% of Fitness Enthusiasts hold Amazon Prime), recent publications have shown otherwise (Subscribify, 2026; Deloitte, 2025; The New York Times, 2026 and

Reddit). Hence, a subscription business model cannot be proposed, although it can serve as a possible competitive edge.

Marketing Positioning and Messaging

Message to Healthy Professionals: "Stay healthy. Stay productive. Backed by insurance science." The value proposition centres on real-time health data, insurance premiums subsidized by employers and wellness rewards system, reaching them via HR, wellness platforms, etc.

For Fitness Enthusiasts: "Train smarter. Perform better. Data-driven edge." Value Proposition: High-end athlete metrics, hard-wearing equipment, and accessibility to employer wellness programs. Reaching out to them via Strava, sponsorship of athletes, etc.

Conclusion

The collaboration between Intel and CVS Health, also implies that of Aetna and Health 100, presents a chance for Intel to capitalize on the under-utilized market gap wherein healthcare credibility goes hand-in-hand with employee accessibility and cost-effectiveness. The segmentation analysis with four segments that were confirmed by the use of convergent diagnostics and statistical tests. Healthy Professionals and Fitness Enthusiasts - 47.4% of the target market for this venture. The B2B to B2C business model entails credibility from the backing of Aetna, leveraging CVS stores and not having the same premium feature of Apple guarantees consistent revenue streams.

University of Exeter Business School

Assignment Cover Sheet	
Candidate Number	
Module Code	BEMM463
Module Name	Marketing Analytics
Assignment Title	Assessment 1

Within the Business School we support the responsible and ethical use of GenAI tools, and we seek to develop your ability to use these tools to help you study and learn. An important part of this process is being transparent about how you have used GenAI tools during the preparation of your assignments.

The below declaration is intended to guide transparency in the use of GenAI tools, and to assist you in ensuring appropriate referencing of those tools within your work.

The following GenAI tools have been used in the production of this work:

CW1 Annotated Bibliography

☐ ***I have used GenAI tools for brainstorming ideas.***
